

BENEFITS OF CWSAdmix

- CWSAdmix is a crystal growth material – or sometimes called “Crystalline waterproofing”
- It provides, simple, effective, LIFETIME WATERPROOFING
- It is ENVIRONMENTALLY FRIENDLY
- It can be applied in 2 ways:
 - Added to the concrete pour as an admixture
 - Trowelled onto an existing wall as a slurry coat
- Unlike membranes, CWSAdmix cannot delaminate, deteriorate, puncture or be damaged by following trades
- It considerably saves on construction time (and therefore money) because it is added to the concrete during the pour.
- It provides LIFETIME WATERPROOFING so no re-application or future maintenance is required

- CWSAdmix remains dormant in the concrete and will reactivate on future contact with water
- CWSAdmix is more effective than other crystal growth materials because:
 - It is supplied as a CONCENTRATE.
 - Other crystal growth materials are normally supplied as a mixture with sand and cement.
 - Some of these materials have diluted the concentrate to the extent that the effectiveness of the product becomes doubtful
- Effective against positive or negative water pressure.
- Suitable for use with potable water.
- Because CWSAdmix is a concentrate it has an unlimited shelf life.
- CWSAdmix is very competitive in price, regardless of whether it is compared to traditional membranes or other crystal growth materials.
